

Thermal imaging can be an invaluable tool when performing routine maintenance on distribution equipment and lines. Infrared testing with a thermal imaging camera can help diagnose problems before they become catastrophic, significantly reducing downtime and minimizing the cost of repairs.

This same technology is also useful for assessing prior repairs that have been done to remove impediments to the distribution system. Checking the current status of these repairs can also be an important part of your maintenance procedures.

## OVERVIEW

This service provides a cost-effective way for industrial customers to conduct routine maintenance to distribution equipment and lines. Infrared testing can identify possible problems before they cause disruptions to your operations and require costly repairs.

We will arrange to bring a thermal imaging camera to your facility and conduct on-site diagnostics. Based on the results, we will make recommendations regarding any repairs or maintenance that might be indicated.
